Signs with smart connectivity for Better road safety

The screenshot shows a Python script named `publish.py` in a text editor. The script imports `paho.mqtt.client` as `paho`, `time`, and `random`. It defines a function `on_publish` that prints "Publish the data". The main logic creates a `paho.Client`, connects to `broker.mqttdashboard.com` on port 1883, and enters a `while True` loop. In the loop, it generates a random integer between 1 and 30, publishes it to the `iottopic` with a QoS of 1, prints the value, and sleeps for 10 seconds.

Overlaid on the script is a terminal window titled "Python 3.6.5 Shell" showing the execution output. It displays the Python version and build information, followed by a restart message. The output shows the script publishing the data with values 7, 19, 10, and 10.

```
#Through python coding we are going to access the subscriber
import paho.mqtt.client as paho
import time
import random

def on_publish(client, userdata, mid):
    print("Publish the data ")

client = paho.Client()
client.on_publish = on_publish
client.connect('broker.mqttdashboard.com', 1883)
client.loop_start()
while True:
    temp = random.randint(1,30)
    (re,mid) = client.publish('iottopic',str(temp),qos=1)
    print(temp)
    time.sleep(10)
```

```

```

The screenshot shows a Python script named `subscribe.py` in a text editor. It imports `paho.mqtt.client` as `paho`. It defines two functions: `on_subscribe`, which prints the subscriber ID and granted QoS, and `on_message`, which prints the topic, QoS, and payload. The main logic creates a `paho.Client`, connects to `broker.mqttdashboard.com` on port 1883, subscribes to the `iottopic` with a QoS of 1, and calls `client.loop_forever()`.

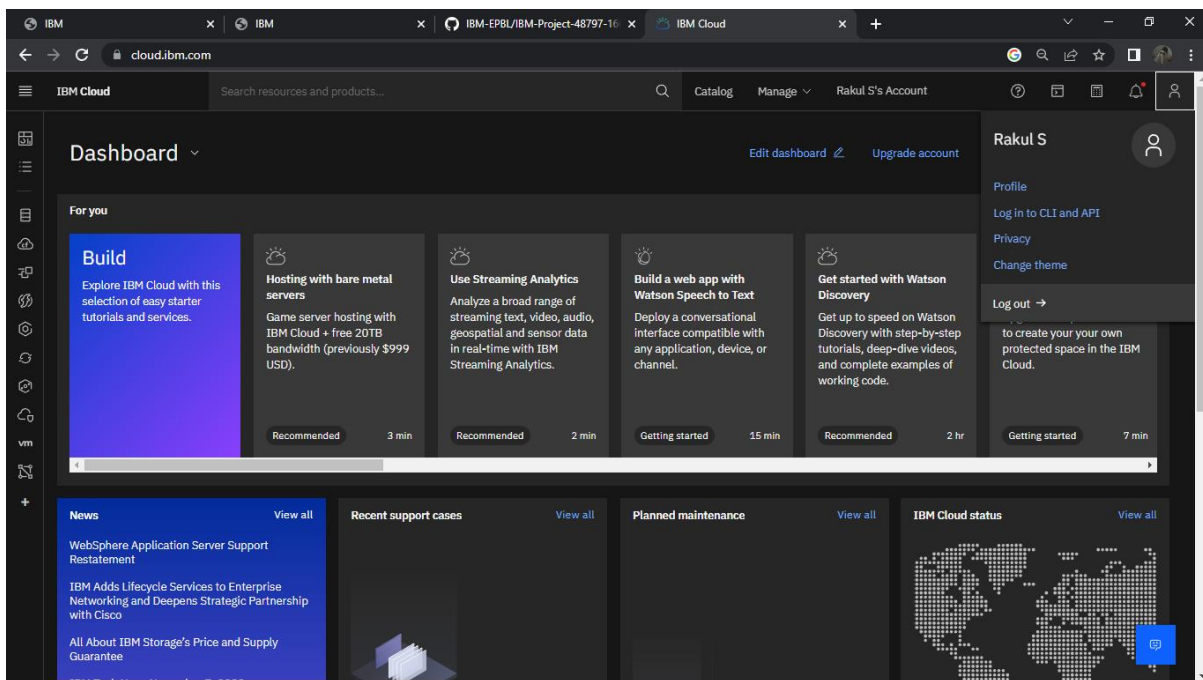

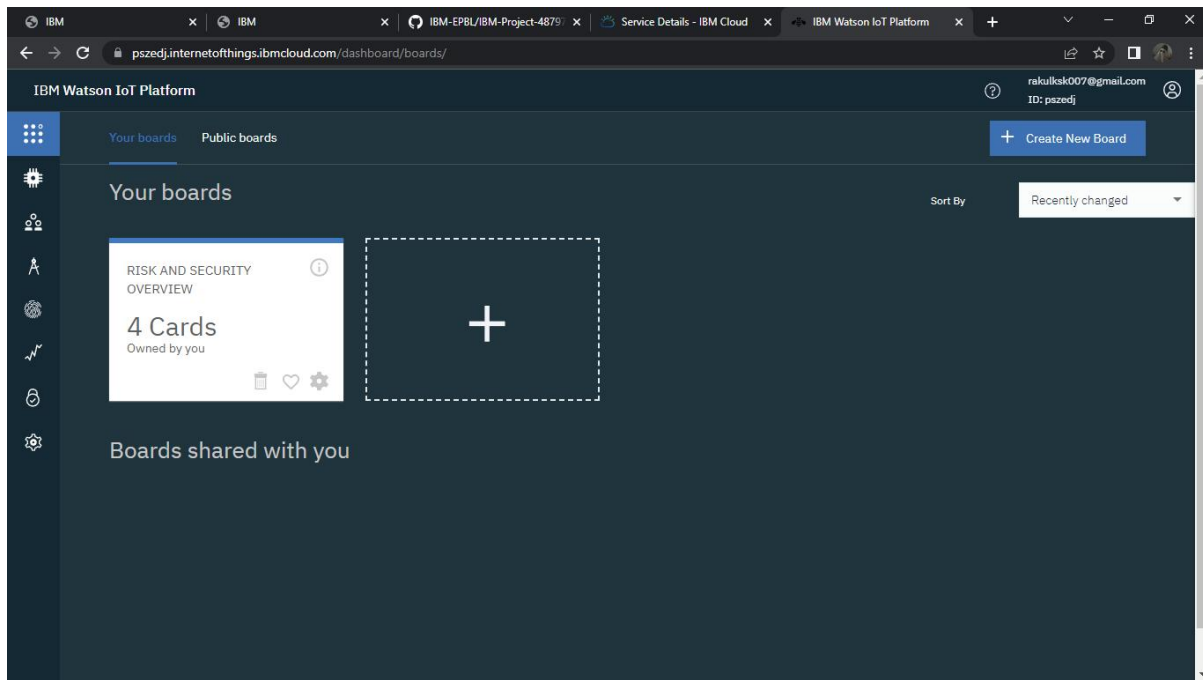

Overlaid on the script is a terminal window titled "Python 3.6.5 Shell" showing the execution output. It displays the Python version and build information, followed by a restart message. The output shows the script publishing the data with values 13, 3, 25, 19, 2, 7, 9, and 9.

```
import paho.mqtt.client as paho
def on_subscribe(client,userdata,mid,grated_qos):
    print("subscriber:" + str(mid)+str(granted_qos))

def on_message(client,userdata,msg):
    print(msg.topic + "" + str(msg.qos) + "" + str(msg.payload))

client = paho.Client()
client.on_subscribe = on_subscribe
client.on_message = on_message
client.connect('broker.mqttdashboard.com', 1883)
client.subscribe('iottopic',qos=1)
client.loop_forever()
```
